Comments

You all met all of your commitments and more. You continue also to cohere well as a team as far as I can see and I have little worry about your future success. Keep up the great work. PS: props for adding a help page!

Quality:

A few redundant initializations throughout the code

Some methods in `ClientRunnable` can have private access but do not.

For handling specific messages, the strategy design pattern may be an applicable refactoring

I wouldn't consider this mandatory, but the `getGroup` method looks pretty large and may be a candidate for refactoring. This may be applicable anywhere you have an if statement/loop with a lot of stuff going on inside of it.

Group constructor documentation refers to a parameter that does not appear in the constructor.

Constructors such as `user`, `message` may warrant validation for the inputs to them.
